IntuiLink Waveform Editor

The Agilent IntuiLink Arbitrary **Waveform Editor** application is an ActiveX document server. This application provides a <u>graphical</u> user interface (GUI) that allows you to *create, import, modify*, and *export* arbitrary waveforms, and to *send* these waveforms to the Agilent type 33120A, **33220A** or 33250A Arbitrary Waveform (ARB) Generator instrument. The user interface is shown below with its main areas identified by numbers:

Let's look at each of these numbered areas in turn.

1. Menu Bar - provides standard Microsoft Windows style menus.

2. Standard Toolbar - provides toolbar buttons for such standard menu functions as Save, Cut, Paste, and Print.

3. Waveform Toolbar - provides toolbar buttons for the arbitrary waveform Creation and Edit functions. In particular, these buttons allow you to Add waveform <u>segments</u> to the active waveform edit window.

4. Waveform Edit Windows - each of these windows allows you to **create**, **edit**, and **display** an arbitrary waveform. (Waveform *defaults* – see: <u>Appendix A</u>.) The contents of the <u>active</u> waveform edit window can be **sent** to an Agilent ARB Generator.

5. Status Bar - displays messages about the following:

- General status messages.
- The current mode.
- In Select mode, the start and end positions and number of points selected.
- In Marker mode:
 - \cdot When an X marker is being moved, the positions of both X markers and the difference between them. \cdot When a Y marker is being moved, the positions of both Y markers and the difference between them.
- In Freehand or Line Draw mode, the cursor position and the length of the waveform.
- The **address** of an arbitrary waveform generator (for example: GPIB0::10::INSTR) if one is <u>connected</u>, or else Disconnected.

Connecting to Instrument:

From Communications

menu select Connection ...

• Make sure that your Instrument is physically connected to your computer and turned ON.

• In the **Connection Dialog** highlight the address from the Select Address and click Identify Instrument. (Or double-click to perform Identify task.) The instrument type, name and address appear. Highlight the instrument that you wish to connect and click Connect. (Or double-click to Connect to it.)

Connection Dialog				×
Select Address(es)	-Identified Instruments on My	Computer -		
GPIB0::7::INSTR	Instrument Type	Name	Manufacturer	Address
GPIB0::10::INSTR	🙀 Arb	33120A	HEWLETT-PACKA	GPIB0::10:
My Computer	Instrument(s) with Instrument	t Type in bo	ld are supported.	
Identify Instrument(s)	Connect Disconn	ect C	connected	
			Close	Help

- A green icon appears to the left of instrument that is connected.
- Once you have established a connection, click OK. Waveform Editor will **remember** the connection for any future sessions. If the instrument I/O address is changed, be sure to reset the connection.

You are now ready to send waveform to the instrument.

Configuration of Waveform Edit Window parameters:

See – <u>Appendix A</u>.

About arbitrary waveforms

For most applications, it is not necessary to create an arbitrary waveform with a specific number of points since the **33220A** ARB generator will repeat points (or interpolate) as necessary to fill waveform memory.

For *standard* waveforms, and arbitrary waveforms that are defined with fewer than 16,384 (**16K**) points, the function generator uses waveform memory that is 16K words deep. For *arbitrary* waveforms that are defined with more than 16K points, the function generator uses waveform memory that is 65,536 (**64K**) words deep.

The **33220A** represents amplitude values by 16,384 discrete voltage levels (or **14-bit** *vertical* resolution). The specified waveform data is divided into *samples* such that one waveform cycle exactly fills waveform memory. If you create an arbitrary waveform that does not contain exactly 16K or 64K points, the waveform is automatically "stretched" by repeating points or by interpolating between existing points as needed to fill waveform memory.

For the 33220A, you do not have to change the length of the waveform to change its output frequency.

All you have to do is create a waveform of any length and then adjust the function generator's output frequency. However, in order to get the best results (and minimize voltage quantization errors), it is recommended that you use the <u>full</u> range of the waveform DAC: from **-1 to +1 relative amplitude** (or 0 to 16381 [**14-bit**] DAC codes).

Remember, if you create an arbitrary waveform that includes *three* cycles of a waveshape (for example), the <u>output frequency</u> will be *three* times the value displayed on the function 0generator's front panel.

When creating arbitrary waveforms, the function generator will always attempt to **replicate** the finite-length time record to produce a <u>periodic version</u> of the data in waveform memory. However, as shown below, it is possible that the shape and phase of a signal may be such that a transient is introduced at the end point. When the waveshape is repeated for all time, this <u>end-point transient</u> will introduce *leakage error* in the frequency domain because many spectral terms are required to describe the discontinuity.

Leakage error is caused when the waveform record does *not* include an *integer* number of cycles of the fundamental frequency. Power from the fundamental frequency, and its harmonics, is transferred to spectral components of the rectangular sampling function. Instead

of the expected narrow spectral lines, leakage can cause significant spreading around the desired spectral peaks. You can reduce leakage errors by adjusting the **window** length to include an integer number of cycles or by including *more cycles* within the window to reduce the residual end-point transient size.

Some signals are composed of discrete, non-harmonically related frequencies. Since these signals are non-repetitive, all frequency components cannot be harmonically related to the window length. You should be **careful** in these situations to minimize end-point discontinuities and spectral leakage.

About signal imperfections **33220A** type ARB generator (**14-bit**, 50 MSa/s, **64K** [or 16K] points)¹

For sine waveforms, signal imperfections are easiest to describe and observe in the frequency domain using a spectrum analyzer. Any component of the output signal, which has a different frequency than the fundamental (or "carrier") is considered to be spurious. The signal imperfections can be categorized as *harmonic*, *non-harmonic*, or *phase noise* and are specified in "decibels relative to the carrier level" or "dBc".

Harmonic Imperfections Harmonic components always appear at multiples of the fundamental frequency and are created by non-linearities in the waveform DAC and other elements of the signal path.

Non-Harmonic Imperfections The biggest source of non-harmonic spurious components (called "spurs") is the waveform DAC. Nonlinearity in the DAC leads to harmonics that are aliased, or "folded back", into the passband of the function generator. These spurs are most significant when there is a simple fractional relationship between the signal frequency and the function generator's sampling frequency (50 MHz).

For example, at 15 MHz, the DAC produces harmonics at 30 MHz and 45 MHz. These harmonics, which are 20 MHz and 5 MHz from the function generator's 50 MHz sampling frequency, will appear as spurs at 20 MHz and 5 MHz.

Another source of non-harmonic spurs is the coupling of unrelated signal sources (such as the microprocessor clock) into the output signal. These spurs usually have a constant amplitude (< -75 dBm or 112 μ Vpp) regardless of the signal's amplitude and are most troublesome at signal amplitudes below 100 mVpp. To obtain low amplitudes with minimum spurious content, keep the function generator's *output level* relatively <u>high</u> and use an external attenuator if possible.

Phase Noise Phase noise results from small, instantaneous changes in the output frequency ("jitter"). It is seen as an elevation of the apparent noise floor near the fundamental frequency and increases at 6 dBc / octave with the carrier frequency. The **33220A**'s phase noise specification represents the amplitude of the noise in a 1 Hz bandwidth, 10 kHz away from a 20-MHz carrier (-115 dBc/Hz, typical).

Quantization Errors Finite DAC **resolution** (14 bits) leads to *voltage quantization errors*. Assuming the errors are uniformly distributed over a range of ± 0.5 least-significant bit (LSB), the equivalent noise level is -86 dBc for a sine wave that uses the <u>full</u> DAC range (16,384 levels). Similarly, **finite-length** waveform memory leads to *phase quantization errors*. Treating these errors as low-level phase modulation and assuming a uniform distribution over a range of ± 0.5 LSB, the equivalent noise level is -76 dBc for a sine wave that is 16K samples long. All of the **33220A**'s <u>standard</u> waveforms use the entire DAC range and are 16K samples in length. Any arbitrary waveforms that use less than the entire DAC range, or that are specified with fewer than 16,384 points, will exhibit proportionally higher relative quantization errors. (Note: arbitrary waveform length 2 to **64K** points.)

With the **33220A**, you can output an arbitrary waveform to an upper frequency limit of 6 MHz. However, note that the *useful* upper limit is usually less due to the function generator's bandwidth limitation and aliasing. Waveform components above the function generator's -3 dB bandwidth will be attenuated.

¹ Signal imperfection for 33120A type ARB generator – see <u>Appendix B</u>.

About on-line help

The Waveform Editor Help provides the following help books in the table of contents:

 \cdot **Introduction** to the Waveform Editor provides a *short* introduction to the waveform editor application.

 \cdot Using the Waveform Editor provides *task-oriented* how-to topics on how to use the waveform editor.

 \cdot Waveform Editor **Reference** provides a reference topic for *each* waveform editor command or dialog box.

Note:

Certain standard dialog boxes such as **Communication** | Connection or Send; **Math** | Filter | Low Pass; **Math** | Waveform Math; **Tools** | FIR Filter etc. have a help. Click on this button, and then click on the area of interest in the dialog box to obtain help for these dialog boxes.

Creating and editing waveforms:

Inserting a segment

You can insert standard waveform segments using the waveform toolbar icons. When you click the desired icon the segment is inserted (with its default parameters) in the <u>active</u> waveform edit window.

To change the parameters (or waveform) of an existing segment, <u>double-click</u> on the segment and **Segment Parameters** dialog box appears.

You can insert standard waveform segments using the menu (Edit | Insert Segment) and the Segment Parameters dialog box.

You can continue to insert segments to an existing waveform, provided there is room in the edit window for the segment to be inserted. Segments are always inserted on the <u>right side</u> of the waveform.

Drawing an Arbitrary Waveform

<u>Freehand</u> mode allows you to draw any shape that you want, while <u>Line Draw</u> mode allows you to draw a series of straight lines.

Both Freehand and Line Draw mode may be used anywhere within the window, except where a standard segment has been inserted. If the window already contains a waveform segment, the drawing will start at the right edge of that segment.

Selecting (i.e. highlighting) waveform data

You can select <u>all</u> or a <u>portion</u> of a waveform as described below.

Note: Once you have selected the waveform data, you can operate on the data with one of the <u>Math menu</u> functions, or with **Cut**, **Copy**, or **Paste** in the Edit menu.

1. To select a *standard* waveform segment within the waveform:

Click on the small *blue triangle* above the waveform segment.

- Or, double-click anywhere within the waveform segment.
- 2. To select the <u>entire</u> waveform:

In the Edit menu (or after <u>right</u> mouse click within waveform window), click on Select All.

3. To select a <u>portion</u> of the waveform:

If you are not already in **Select** mode, click on the **b** icon in the toolbar (or from the **Edit** menu click on Select).

Click the <u>left</u> mouse button at the start of the desired portion of the waveform, drag, and release the mouse button when the desired area is highlighted. (You can drag either left-to-right or right-to-left.)

Using Markers (click on the kicon)

Markers can be used as guides for freehand or line drawing, or to <u>specify an area</u> of a waveform to be clipped.

In **Marker** mode, when you move an X marker, the X marker positions are shown in the status bar. When you move a Y marker, the Y marker positions are shown in the status bar.

Use Pin Markers to define an area where you can perform freehand or line drawing over standard segments. You can draw only in the area defined within the pinned X and Y markers. (Note that any potential discontinuities at the ends of the freehand area are automatically corrected with straight lines connecting to the original waveform.)

The **pinned** markers change color and the handles disappear. You cannot move markers that are pinned.

<u>Clipping a Waveform</u>: The **Clip** math function clips the *selected* waveform data to the specified Y values. Position the markers to the desired clipping values (click and drag the triangular handles at the left end of the markers), select the portion of the waveform, then Clip the waveform (from the **Math** menu select Clip) to the values specified by the *pinned* Y markers.

Zoom using a 'magnifying glass'

Allows you to zoom into a specified area of the waveform edit window. Select Zoom to turn zoom mode on. The cursor *changes* to a magnifying glass.

The zoom locator box in the Thumbnail View window outlines the portion of the waveform currently displayed in the waveform edit window. This box changes as you zoom in and out and can be moved by clicking and dragging it.

Sample Files

Use File | Open ... or click the File **Open** icon to open these files. Once open, the waveform can be edited, inserted, or copied.

Importing waveform from Scope

See: **Tools** | Import Waveform (Agilent 546xx Scope)

Performing waveform Math

The **Math** menu contains several math functions to be performed on waveforms. The first three (**add**, **sub**, and **mult**) combine <u>two</u> operands (**point-by-point**) while the remaining functions performed on a <u>single</u> operand.

Note: The first waveform is the waveform or portion of a waveform that you have *selected* (i.e. highlighted) in the <u>active</u> waveform edit window. The second waveform is either a *standard* waveform **or** a waveform that has been copied to the *clipboard*.

The *Windowing* or the *Low Pass filter* function always applies to the <u>entire</u> waveform, whether or not the waveform or a portion of it has been selected.

The Extended Cosine, Raised Cosine, and Hamming **windowing** functions can be used to correct for distorted spectral information where there are discontinuities at the end point of the window, or when the frequency components of the waveform are not harmonically related to the window length. (More filter ... **Tools** | FIR Filter.)

By default, the *Smoothing* filter performs a 7-point moving average. However, you can change the number of points from the Properties dialog box (from the File menu, select Properties).

More Math ... Tools | Equation Calculator; Tools | Pulse Maker.

Send Arbitrary Waveform:

Click on the *icon* in the waveform toolbar (or select the 'Send Waveform ...' command from the Communications menu) to display the **Send Arbitrary Waveform** dialog box.

Note:

If you click on the *icon* or 'Send Waveform ...' command when no instrument is connected, the Connection dialog box appears. (See **Connecting** to Instrument.) Once a connection has been established, the **Send Arbitrary Waveform** dialog box appears.

The dialog box provides two tab pages.

Manage Waveforms Tab:

Activate or delete the waveforms currently in the instrument's memory.

end Abitrary Waveforr	n	>
Send Waveform Mana	ge Waveforms	
Vaveforms on the In: * NEG_RAMP * EXP_RISE * EXP_FALL * CARDIAC * PULSE BACH AUDIO	Delete Activate	
* VOLATILE	* Indicates a built-in waveform	
	<u>C</u> lose <u>H</u> elp	

Waveforms on the Instrument:

Lists the available waveforms **stored** on the instrument.

- To **activate** one of the waveforms, select its name and click on the Activate button.
- To delete one of the non-permanent waveforms from the instrument, select its name and click on the Delete button.

Permanent, <u>built-in</u> waveforms are indicated with an asterisk (*) preceding the name. These waveforms cannot be deleted from the instrument. Also, you cannot delete the <u>currently active</u> waveform. (To get around this, activate a different waveform and then select the one that you want to delete.)

Send Waveform Tab:

Specify parameters and then send (download) of the contents of the <u>active</u> waveform edit window to previously connected instrument.

	ʻm

O Waveform Param	neters Only	Send

Waveform Parameters:

- Frequency (kHz): The function generator repeat-frequency.
- Amplitude (Vp-p): The peak-to-peak amplitude of the repeating waveform.
- Offset (Vdc): The dc offset to the waveform.

Reset Parameters:

Click on **Reset** to restore the selected parameters:

- Defaults for Waveform: The default parameters saved with the waveform in the file.
- Current from Instrument: The current parameters retrieved from the instrument.

Waveform Location on Instrument:

- Volatile Memory: Save the waveform in the instrument's *volatile* memory.
- Memory Name: Save the waveform in the <u>named location</u> on the instrument.

Send to Instrument:

- Waveform and Parameters: Send the waveform and its parameters.
- Waveform **Parameters Only**: Send only the parameters to save time when the waveform has already been sent.

Once you have specified all the parameters, <u>click on Send</u> to send the waveform to the instrument. A message is then displayed with an <u>estimated time</u> to complete the send operation. (Click **OK**.)

Supported Data File Formats:

The Agilent IntuiLink Arbitrary Waveform Editor supports several data file formats, which are listed below.

Data files can be saved with the **Save** and **Save** As commands, and opened with the **Open** command from the File menu.

- 1. **Waveform (.WVF)** File Format. This is the *default* format used for arbitrary waveform files saved using the waveform editor.
- 2. **Comma-Separated Values (.CSV)** File Format. This format uses the comma as the delimiter between columns, and a carriage-return/line-feed to terminate each row.
 - <u>The waveform editor reads .CSV files from Microsoft Excel and other</u> <u>applications</u>. The waveform editor reads the last column containing data as the waveform data column to be compatible with Agilent BenchLink Arb and most other applications including Excel.
 - The waveform editor **saves** .CSV files in a special format, shown below in an Excel spreadsheet:

	Α	В	С	D	E	F	
1	Data	Name	Freq (kHz)	Ampl (VPP)	Offset (VDC)	Points	
2	0.315165	VOLATILE	2	0.5	0.2	13577	
3	-0.1919						
4	-0.9704						
5	0.0049						
6	0.9363						
7	0.2413						
8	0.0164						
9	0.6583						
10	0.717						

Row 1 is used to store the column headers. The waveform data points are saved in the column A, which may be several thousand points in length. Succeeding columns are used to store the waveform parameters. In our example, columns B through F store the name, frequency, amplitude, offset, and number of points in the waveform.

Note:

The **.**CSV file format supports only the US English number format, with periods used as decimal points. This is because the comma is used as the delimiter. (See <u>Appendix D</u>.)

Text (.TXT) File Format. This format puts all of the data points in a single column, with a carriage-return/line-feed after each value.
 If you read the file into Excel, the data points will be in column A, and that column may be several thousand points in length. This format can be used with <u>localized</u> number formats (for example, using the comma as the decimal point).

- 4. **Text (.PRN)** File Format. This format puts all of the data points in a single row, using the space as the delimiter between data points. If you read the file into **Excel**, the data points will be in row number 1, and that row may be several thousand points in width. This format can be used with <u>localized</u> number formats (for example, using the comma as the decimal point).
- Picture (.BMP) File Format (Save Only). You can save a raster representation of your waveform in a Windows Bitmap (.BMP) file. This makes it convenient to include a picture of your waveform in Microsoft Word or other applications. However, this picture no longer consists of waveform data. You cannot open a .BMP file in the waveform editor, and you will need to save your waveform

data in one of the other supported formats.

(*Note*: There is also a waveform setup file format (.WFG), which is used to save the current instrument setup for type 33250A ARB generator: File | Save, Load ...)

Printing waveforms:

Click on the icon to output a printout using the *current* configuration. From the **File** menu select either Print or Print Preview to display the Print dialog box. This dialog box provides two tabs: the **Preview** tab shows what your printout will look like with the current layout; go to the **Page Layout** tab page to change the layout.

Waveform Tab:

- Currently Connected Oscilloscope: Shows the address of the currently connected oscilloscope.
 - If no scope is connected, go to the **Connect to Oscilloscope** *tab*.
- · Channel: Specify the oscilloscope <u>channel</u> to import.
- Number of Points (Agilent 546xx only): Specify the number of points to import.

Connect to Oscilloscope *Tab*:

The Oscilloscope Address is shown. To connect an oscilloscope, click on the Connect to Oscilloscope button. The **Connection Dialog** box appears.

Tools | Equation Calculator

Creates *noise* waveforms (see: next page) or waveform from *mathematical expressions* (see: <u>Appendix E</u>). Use the View page to verify that you've built the waveform you want.

Select Waveform

In the **Selection** tab, select the number of points required and select either **Equation** to create a waveform from an equation, or select one of the noise types available.

Maximum and Minimum value

The minimum and maximum value can be either 0 to +1, -1 to 0 or -1 to +1. When selecting -1 to +1 the zero value is preserved and only one polarity may have a maximum of -1 or +1.

White uniform noise White normal noise	Creates noise whose amplitude is equally distributed. Noise whose amplitude is normally (Gaussian) distributed.
Pink noise	Noise with a 1/f frequency distribution. The noise falls off in frequency at 10dB/decade.
Random ₩alk	Noise where each subsequent point is created by adding a random number to the previous point.
Brown noise	Same as Random Walk, except that the end point is forced to zero to avoid a step at the end of the data set. Frequency falls off at 20dB/decade.

View Waveform

Preview

You preview the waveform by selecting the **View** tab.

Selected point

You can read the x-axis value and the corresponding amplitude on the line graph by carefully clicking the mouse curser on a graph point. For steep vertical lines try several spots on the line since you must hit one of the points available. Fourier Transform

Select Alt-F or right click on the chart to create a simple plot of the frequency domain. A dialog will pop up. Enter the highest required frequency on the frequency plot. The higher the frequency, the longer the computation will take. Caution: The frequency plot is an ideal. The actual spectrum on the Function Generator will have a higher noise floor depending on the resolution of the digital to analog converter of the function generator.

Сору

Right click on the chart to copy the data and picture of the waveform or the Fourier transform to the clipboard. You can then **Paste** the data into Excel or Word. Use **Paste Special...** to paste the picture.

Click on OK to transfer the waveform to the Waveform Editor.

Examples: "colors of noise"

Many test of electronic equipment and components use **white** noise, **pink** noise or **Brown** noise. The figures show the four of noise *plotted* and *Fourier transformed* with Equation Calculator (4000 points)

Brown, 1/f² (-20dB/decade)

(B) About signal imperfections - <u>33120A</u> type ARB generator (**12**-bit, **40** Msa/s, **16**K)

Most signal imperfections are easiest to observe in the frequency domain using a spectrum analyzer. Sampling theory predicts the location and size of spurious signals resulting from the sampling processes used by DDS generators.

In fact, since DDS generators use a **fixed** sampling rate (**40 MHz** for the 33120A), spurious signals can be removed with a fixed frequency "anti-alias" filter.

A 17 MHz, ninth-order elliptical filter providing a sharp cut-off (in excess of 60 dB attenuation for signals greater than 19 MHz) is used for sine wave outputs. A 10 MHz, seventh-order Bessel filter is used for non-sine wave outputs. The Bessel filter provides slower amplitude roll-off for antialias filtering, but maintains linear phase response to minimize shape distortion for complex waveshapes. The <u>33120A</u> **automatically** selects the appropriate filter when the output function is selected.

All digital-to-analog converters (DACs), including those used in DDS generators, produce spurious signals resulting from non-ideal performance. These spurious signals are harmonically related to the desired output signal. At lower frequencies, the <u>33120A</u>'s **12-bit** waveform DAC produces spurious signals near the -74 dBc level (decibels below the carrier or output signal). The <u>33120A</u> uses the <u>complete</u> **vertical** resolution (N=I) of the DAC for all <u>internal</u> waveshapes, thus minimizing *amplitude quantization error*.

At higher output frequencies, additional DAC errors produce non-harmonic spurious outputs. These are signals "folded back" or aliased to a frequency within the signal bandwidth. A "perfect" DAC will also produce a wideband noise floor due to amplitude quantization. The noise floor for a 12-bit DAC will be near the -74 dBc level; this corresponds to a <u>noise density</u> of -147 dBc/Hz for **sine wave** outputs ² from the <u>33120A</u>.

Amplitude Quantization $\leq -(20 \times \log_{10}(N \times 4096) + 1.8) dBc$

where "N" is the fraction of available DAC codes used to describe the signal waveshape ($0 \le N \le 1$).

Another type of waveform error visible in the frequency domain is *phase truncation error*. This error results from time quantization of the output waveform. Whenever a waveshape is described by a <u>finite number</u> of **horizontal** points (length), it has been sampled in time (or quantized) causing a phase truncation error. Spurious signals caused by phase truncation introduce jitter into the output waveform. This may be regarded as time (and phase) displacement of output zero crossings.

Phase truncation causes phase modulation of the output signal which results in spurious harmonics (see the equation below). For lower output frequencies, the phase accumulator periodically *does not* advance RAM addresses, causing the DAC to deliver the same voltage as recorded on the previous clock cycle. Therefore, the phase "slips" back by 360^{0} / *points* before continuing to move forward again. When RAM address increments are the same on each cycle of the output, phase truncation error (and jitter) are essentially zero. All <u>standard</u> waveshapes in the <u>33120A</u> are generated with *at least* 16,000 waveform points which results in spurious signals below the wideband noise floor of the DAC.

Phase Truncation Harmonics $\leq -20 \times \log_{10} (P) dBc$

where "P" is the number of waveform points in RAM.

² The noise power is <u>normalized</u> to a 1 Hz bandwidth by simply subtracting $10 \cdot \log(f_{sample}/2) = 10 \cdot \log(40 \cdot 10^6/2) = 73$ from the SNR value.

(C) Sample files:

File name	Description	Size (N° of points)
Dtmf_0.csv	Telephone Dual Tone Multi-Frequency (DTMF) Signal – Key 0 (really: Key *) Send : 10 Hz	8K
Dtmf_9.csv	Telephone Dual Tone Multi-Frequency (DTMF) Signal – Key 9 Send: 10 Hz	8K
Full_rec.csv	Full wave rectified sine wave	8K
Gausian.csv	Gaussian pulse created in Mathcad and imported	8K
Half_rec.csv	Half-wave rectified sine wave	8K
Hc_Gate.csv	74HC family digital signal, captured and imported from HP BenchLink/Scope	4K
NoiseSine.csv	Sine wave with high frequency noise added	8K
nonlin_1.csv	Sine wave with third harmonic distortion (Fourier synthesis)	8K
Pk_spike.csv	Sine wave with spike added to each peak	8K
Psk.csv	Phase Shift Keying modulated signal	8K
Pulse_10.csv	10 level sine wave approximation	8K
Ring.csv	Square wave with ringing (Fourier synthesis)	4K
Scr.csv	Quarter cycle SCR signal	8K
Serial.csv	11-bit frame of serial data	4K
Sm_duty.csv	0.1% duty cycle square wave signal Send: 100 Hz	4K
Stair.csv	10 step staircase ramp signal	8K
Trapazd.csv	Trapeziodal pulse **	4K
TwoTone.csv	Two tone signal for intermodulation test Send: 70 Hz	8K

** <u>Example</u>: if you **cut** the *last* 1K points from a 'Trapazd' segment, you get a 50% duty cycle trapezoidal pulse *series* with the following **spectrum**:

(D) Exporting waveform to Excel:

If you want to export waveform data from the waveform editor to Microsoft **Excel**, you can save the data as a **.CSV** file. Follow these steps:

- 1. Create and edit the waveform to be saved.
- 2. From the File menu, select **Save As**. The Save Waveform As dialog box appears:
 - a. Enter a name in the File Name field.
 - b. For Save as Type, select **CSV** (comma delimited) (*.**CSV**).
 - c. Click on Save to save the file. The .CSV extension is appended to your file name automatically.
- 3. The file is now *saved* as a .CSV file, and can be *read* into Microsoft Excel.

Note:

The .CSV file format uses the comma as the delimiter. Therefore, the European localized number format cannot be used, with commas as the decimal point. However, the waveform editor also can export files in the .TXT file format, which does support localized number formats (see Supported Data <u>File Formats</u>).

(E) Waveform: Equation

Operator menu: +, -, *, /, ^ (*raise to the power*), (,) – *parentheses*, **pi** (3.1416), t (*time* 0-1), w (2*pi*t), var (*variable*), 1 = .1E1 – *numerals*

Function menu:

Abs(), ArcTan(), Cos(), Exp(), Fact(), Ln() Noise(1) *uniform*, Noise(10) *normal* Point(), Sin(), Sqrt(), Step(),Tan()

Sample menu:

Sine, 45deg offset: Sin(w-pi/4)

Sine, burst: Step(var)*Step(1/10-var)*Sin(10*2*pi*var) var = t - .4

Sine, burst 3 cycles: Step(var)*Step(3/10-var)*Sin(10*2*pi*var) var = **t-.4**

Noise(5): the argument "5" tells Equation Calculator to take the average of five random values and use the result for the value of the noise() function. Note: averaging a random set of numbers produces a Gaussian distribution, which produces a more realistic noise signal then pure white noise.

Sine with noise burst: Sin(w)+Step(.01+var)*Step(.01-var)*Noise(5)

Sine(x)/x: Sin(5*w)/w

Impulse, windowed: $(1-\cos(w))*\sin(25*var)/var$ var = 2*pi*(t-.5)

Ramp: t

Ramp, negative: .5-t

Exp, rise: 1- Exp(-5*t)

Gaussian: Exp(-.5*((t-.5)/.1)^2)

Ringing square wave:

Step(-var)*(.2*Exp(-15*t)*Cos(50*w)+1)-Step(var)*(.2*Exp(-15*(var))*(Cos(50*2*PI*(var)))+1) var = t-.5

Modulation, AM: Sin(20*w)*(1+0.75*Cos(2*w))

Modulation, frequ.: Sin(20*w+10/2*Cos(2*w))

Modulation, phase: Sin(20*w+pi*Sin(2*w))

Modulation, pulse width:

step(sin(20*w+var*cos(1*w)))*step(sin(20*w+var*sin(1*w)))
var = pi/2

Rectified, full wave: Abs(Sin(3*w))

Rectified, half wave: .5*(Abs(var)-var) var = sin(3*w)

Window, extended cosine bell: 2-(1+cos(5*w))*(step(.1-t)+step(t-.9))

Window, half cycle sine: **sin(.5*w)**

Window, Hanning: 1-cos(w)

Window, half cycle sine^3: sin(.5*w)^3

Window, Hamming: 0.08+0.46*(1-cos(w))

Window, Cosine⁴: (0.5*(1-cos(w)))⁴

Window, Parzen:

Step(var)*Step(.5-var)*(1-6*(2*t-1)^2+6*abs(2*t-1)^3)+2*(1-abs(2*t-1))^3*(step(-varpoint(1))+ step(var-.5-point(1))) var = t-.25

Examples:

Lorentz pulse: 1/(1+((t-Tm)/To)^2) Tm – time **location** of center To – **half width** @ 50% amplitude

Lorentz pulse: 1/(1+((t-0.5)/0.1)^2)

Sine^3: Sin(w)^3

PAM (pulse amplitude modulation): t*step(sin(7*w))

Sine amplitude sweep: t*sin(7*w)

LIN sweep: sin(2*pi*Fs*t+pi*(Fe-Fs)/Ts*t^2)) Fs – start frequency, Fe – stop (end) frequency, Ts – sweep duration

Linear frequency sweep: sin(10*w+pi*(20-10)/0.5*t^2)

LOG sweep: sin(2*pi*(Fs/K)*(exp(K*t)-1)), K= In(Fe/Fs)/Ts Fs – **start** frequency, Fe – **stop** (end) frequency, Ts – sweep **duration**

Logarithmic frequency sweep:

sin(2*pi*(10/var)*(exp(var*t)-1)) var = ln(20/10)/0.5

Test signal (bandwidth limited square wave): sin(w)+0.24*sin(3*w)+0.07*sin(5*w)+0.0125*sin(7*w)

Combined sine and straight line: sin(1E1*w)-2*t
