# Legacy platforms replacement

Sipos Attila PKI Fejlesztési Igazgatóság Balatonkenese 2009.05.26.

### **Contents**

- Old legacy systems in MT's network
- Financial statistics
- Technical risks
- Target architecture and migration rules
- Estimated capex and proposed time schedule
- Conclusions

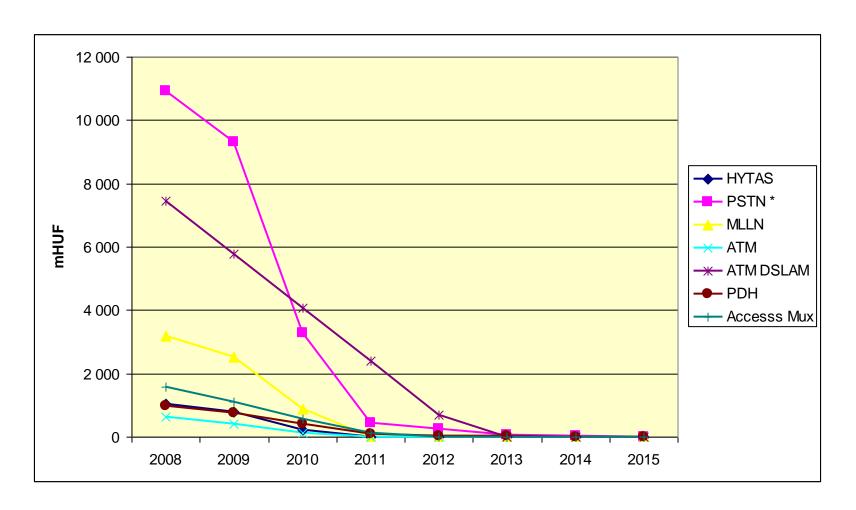

## Old legacy systems in MT's network

Platform	Network size	Average equipment age (year) *
Hytas-Ke	125k POTS; 12k ISDN capacity	12
voice optical access		
PSTN	3.4 M 64kbit/s channel capacity	18
voice switches	3.4 W 64Kbit/3 charmer capacity	10
MLLN	13 000 user equipment at 1000 CO sites	12
narrowband data	13 000 user equipment at 1000 CO sites	12
ATM DSLAM	212k port capacity 451 citos	6
broadband access	213k port capacity 451 sites	U
PDH	1FFF aguinment at 1129 CO sites	15
old transmission	1555 equipment at 1128 CO sites	15
Access Mux-es	36.7k POTS; 2.6k ISDN capacity at 725 sites	11
voice access		11

 $\cdots \mathbf{T}$ 

<sup>\*</sup> average time from purchase weighted by equipment number

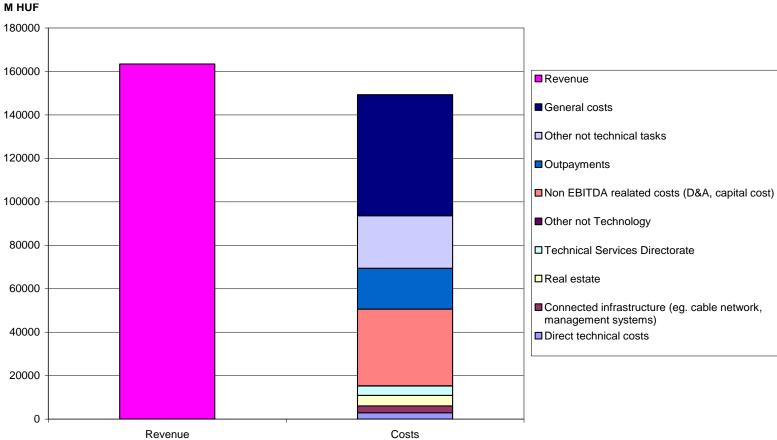

## Book values of legacy systems

<sup>\*</sup> Not including ADS exchanges

## Costs and revenues of legacy systems in 2008

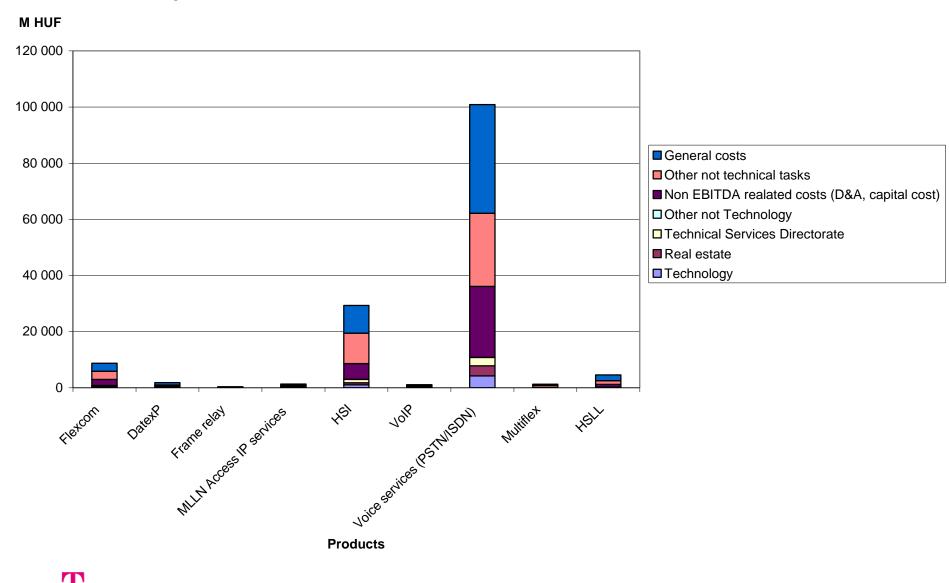

- Legacy systems support to generate 163 BHUF revenue
- The most significant cost components:
  - General costs: 37%,
  - · Outpayments: 13%,

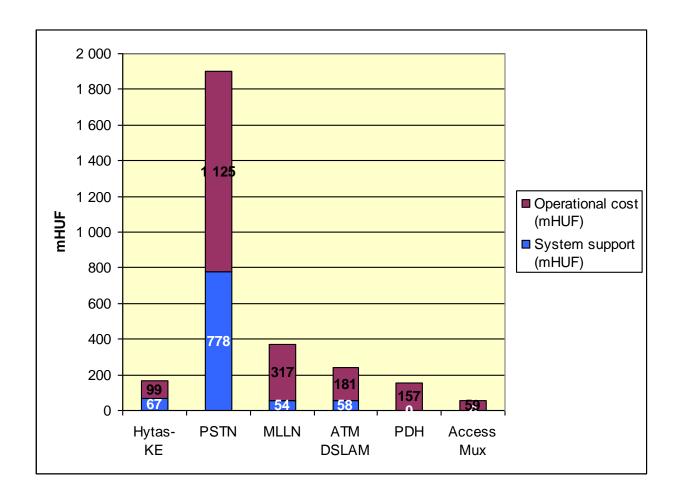

- other not technical tasks (mostly marketing activities): 16%,
- D&A, capital cost: 24%.
- Direct technical cost is only 2% (2,9 BHUF)

## Costs of products in 2008

### Direct technical costs in 2008

### Technical risks

#### General risks

- the equipment are very old, they are at their end of life (EOL) or over EOL
- high probability of equipment failures, difficult to keep the SLAs
- very expensive system support or no system support at all from the vendor
- lack of spare parts
- repairing faulty cards is difficult or not possible

#### PDH specific risk

High risk of equipment faults, especially end of life of Lasers

#### Access Mux specific risk

 difficult and expensive operation due to degradation and increasing saturation of copper cables

### Target network architecture

**Product** 

Residential/Business GPON

Residential/Business DSL

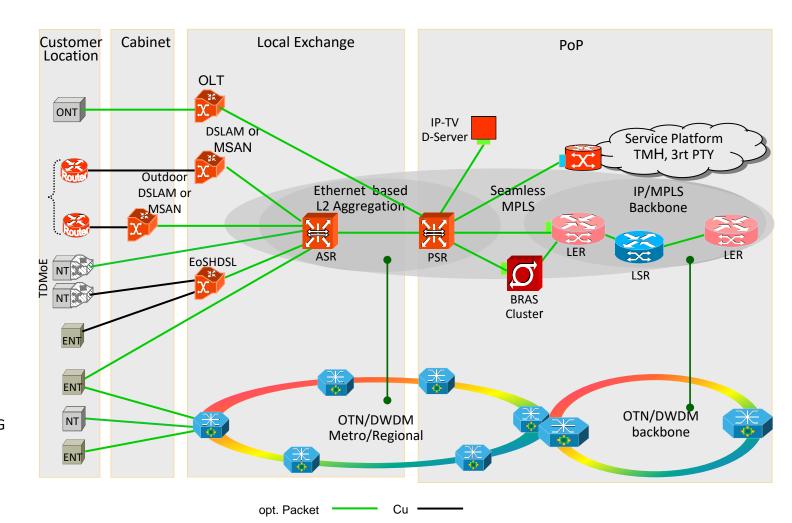

Leased Link 2 ... 155 Mbit/s

Ethernet Link 10M/100M

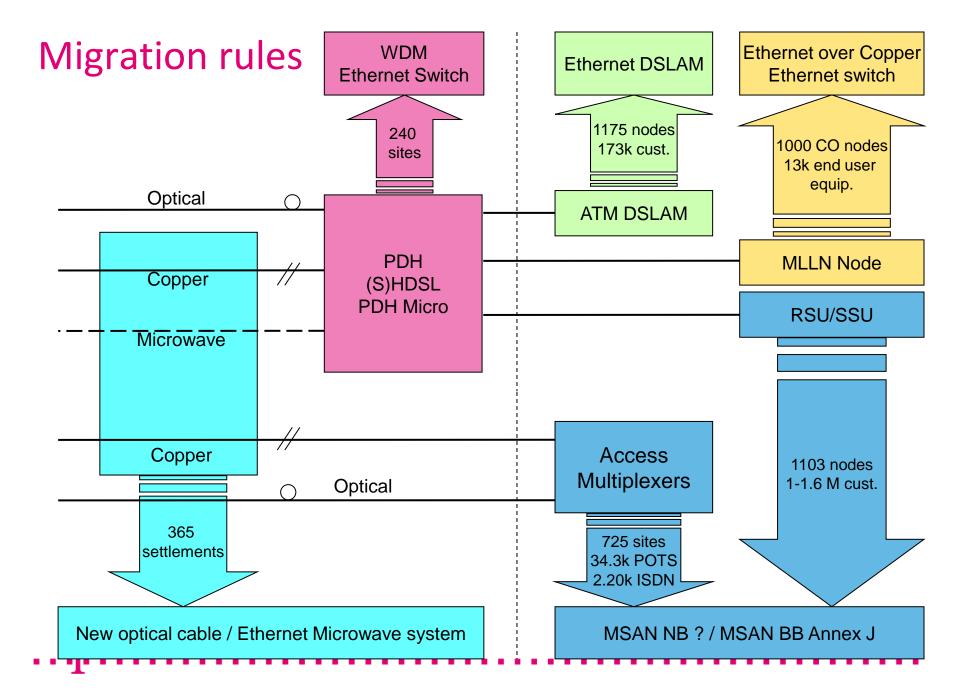

Ethernet Link 1G

Leased Link 2,5G/10G

Ethernet Link10G

### Technical solutions and capex estimation

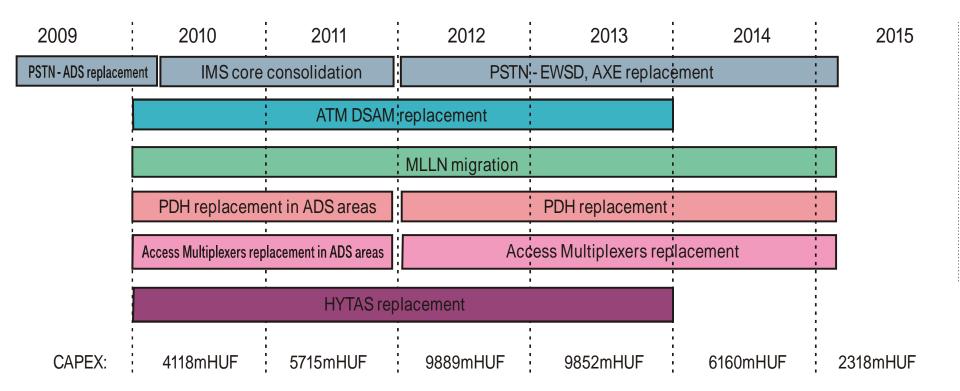

<b>Platform</b>	Short description of replacement	Estimated capex in paralel realisation (mHUF)	
Hytas-Ke	Migration to GPON		
	Migration by MSAN	13400	
	in T-Kábel areas: HFC (DOCSIS 3.0)		
PSTN	replacing PSTN Switches with MGWs and IMS	7000	
	replacing RSUs with MSANs		
	reconstruction of Distribution Frames	3500	
	installing optical cables and microwave links to replace copper cables	620	
MLLN	technology migration to TDMoIP, Eth access for IP VPN and XoT (end-to-end)	2000	
	installing optical cables and microwave links to replace copper cables	1 398	
ATM DSLAM	migrating DSLAM ports to GPON, IP DSLAMs	1200	
	bandwidth limited locations: optical cables and microwave links	624	
PDH	installing WDW/L2 switches	2200	
Access Multiplexers	Installing new MSANs	1450	
-	installing optical cables and microwave links to replace copper cables	4 660	

XoT: X25 over TCPIP 38 052

We presumed that PSTN, MLLN, ATM, PDH and Access Mux replacements will go in parallel, which results appr. 2-3 BHUF save on the optical cable and microwave installations.

### Proposed time schedule

 $\cdots ext{T}$ 

### **Conlusions**

- The full old legacy network replacement CAPEX is apr. 38 MrdFt in the next 6 years
- Hytas replacement shall be achieved independently from other replacements
- The replacement of PSTN, ATM DSLAMs, Access Muxs and MLLN nodes shall be realised together and they shall be harmonised with the PDH transport migration.
- The most significant cost element is the construction of the new transport media optical cable/microwave links on the rural areas
